Smile Solutions Composite Bonding in Melbourne

Composite bonding is one of the most straightforward entry points into cosmetic dentistry, and at Smile Solutions it's done with the same clinical care and artistic attention the team brings to far more involved smile work. Chipped, cracked, discoloured, or slightly misshapen teeth have a way of getting into your head, affecting how you speak, smile, and present yourself day to day. Composite bonding can sort all of that in a single appointment, with no drilling in most cases, no anaesthetic for the majority of patients, and at a fraction of the cost of porcelain restorations.

This guide covers what composite bonding actually is, which teeth it suits best, how your dentist at Smile Solutions approaches the procedure, how long results tend to last, and how to work out whether it's the right call for your smile.

What is composite bonding?

Composite bonding, also called dental bonding or composite resin bonding, is a minimally invasive cosmetic procedure where tooth-coloured resin is sculpted directly onto your tooth, shaped by hand, and hardened with a specialised curing light. It uses the same composite material as white fillings, applied with a personalised, artistic approach that lets your dentist work in real time rather than waiting on a laboratory.

Porcelain veneers are made off-site and bonded on as a finished unit. Composite bonding is different: it's built up layer by layer during your appointment, which gives your dentist precise, hands-on control over the final shape, shade, and texture of each tooth.

The resin is matched to your natural tooth colour and can be used to: - Repair chips and cracks - Close small gaps between teeth (diastema closure) - Mask surface discolouration or staining that doesn't respond to whitening - Reshape teeth that are too short, too narrow, or asymmetrical - Smooth worn or uneven edges - Cover exposed root surfaces

Because no drilling is required in most cases and your natural tooth structure stays largely intact, composite bonding is one of the most conservative cosmetic treatments available. It improves your smile without touching what's already healthy.

Composite bonding at Smile Solutions: the procedure

At Smile Solutions, composite bonding is performed by experienced general dentists in the practice's Level 1 suites inside Melbourne's Manchester Unity Building. **Dr Amina Barucija** has a particular focus and genuine enthusiasm for composite bonding, bringing a sculptor's eye to direct resin work that produces results that look natural and well-integrated rather than obviously cosmetic.

Your treatment follows this sequence:

1. Shade matching Your dentist starts by selecting the composite resin shade that most closely matches your natural teeth. For more involved cases, multiple shades are often layered together to replicate the subtle colour variation that makes results look genuinely lifelike rather than flat or uniform.

Frequently asked questions

What is composite bonding: A cosmetic procedure applying tooth-coloured resin to teeth

What is another name for composite bonding: Dental bonding or composite resin bonding

Is composite bonding minimally invasive: Yes

Does composite bonding require drilling: No, in most cases

Does composite bonding require anaesthetic: No, for the majority of patients

What material is used in composite bonding: Tooth-coloured composite resin

Is composite resin the same material as white fillings: Yes
